

# The Bias Report

Audit Date: 24 Aug 2022

Data Audited: 2062 rows

Attributes Audited:

Sex, Race

Audit Goal(s): Equal Parity - Ensure all protected groups are have equal representation in the selected set.

Proportional Parity - Ensure all protected groups are selected proportional to their percentage of the population.

False Positive Rate Parity - Ensure all protected groups have the same false positive rates as the reference group).

False Discovery Rate Parity - Ensure all protected groups have equally proportional false positives within the selected set

(compared to the reference group).

False Negative Rate Parity - Ensure all protected groups have the same false negative rates (as the reference group).

False Omission Rate Parity - Ensure all protected groups have equally proportional false negatives within the non-

selected set (compared to the reference group).

Reference Groups:

Custom group - The reference groups you selected for each attribute will be used to calculate relative disparities in this

audit.

Fairness

80%. If disparity for a group is within 80% and 125% of the value of the reference group on a group metric (e.g. False

**Threshold:** Positive Rate), this audit will pass.

## **Audit Results:**

- 1. Summary
- 2. Details by Fairness Measures
- 3. Details by Protected Attributes
- 4. Bias Metrics Values
- 5. Base Metrics Calculated for Each Group

# Audit Results: Summary

Equal Parity - Ensure all protected groups are have equal representation in the selected set.

Failed Details

Proportional Parity - Ensure all protected groups are selected proportional to their percentage of the population.

**Failed** Details

False Positive Rate Parity - Ensure all protected groups have the same false positive rates as the reference group).

**Failed** Details

False Discovery Rate Parity - Ensure all protected groups have equally proportional false positives within the selected set (compared to the reference group).

False Negative Rate Parity - Ensure all protected groups have the same false negative rates (as the reference group).

False Omission Rate Parity - Ensure all protected groups have equally proportional false negatives within the non-selected set (compared to the reference group).

Failed Details

**Failed** Details

Failed Details

# Audit Results: Details by Fairness Measures

## **Equal Parity: Failed**

## What is it?

This criteria considers an attribute to have equal parity is every group is equally represented in the selected set. For example, if race (with possible values of white, black, other) has equal parity, it implies that all three races are equally represented (33% each)in the selected/intervention set.

#### When does it matter?

If your desired outcome is to intervene equally on people from all races, then you care about this criteria.

### Which groups failed the audit:

**For Sex** (with reference group as **Male**)

Female with 1.32X Disparity

**For Race** (with reference group as **White**)

Black with **0.08X** Disparity

Go to Top

## Proportional Parity: Failed

#### What is it?

This criteria considers an attribute to have proportional parity if every group is represented proportionally to their share of the population. For example, if race with possible values of white, black, other being 50%, 30%, 20% of the population respectively) has proportional parity, it implies that all three races are represented in the same proportions (50%, 30%, 20%) in the selected set.

#### When does it matter?

If your desired outcome is to intervene proportionally on people from all races, then you care about this criteria.

#### Which groups failed the audit:

**For Sex** (with reference group as **Male**)

Female with **1.40X** Disparity

**For Race** (with reference group as **White**)

Black with **0.56X** Disparity

Go to Top

## False Positive Rate Parity: Failed

#### What is it?

This criteria considers an attribute to have False Positive parity if every group has the same False Positive Error Rate. For example, if race has false positive parity, it implies that all three races have the same False Positive Error Rate.

#### When does it matter?

If your desired outcome is to make false positive errors equally on people from all races, then you care about this criteria. This is important in cases where your intervention is punitive and has a risk of adverse outcomes for individuals. Using this criteria allows you to make sure that you are not making false positive mistakes about any single group disproportionately.

#### Which groups failed the audit:

For Sex (with reference group as Male)

Female with **1.44X** Disparity

**For Race** (with reference group as **White**)

Black with 0.30X Disparity

Go to Top

## False Discovery Rate Parity: Failed

#### What is it?

This criteria considers an attribute to have False Discovery Rate parity if every group has the same False Discovery Error Rate. For example, if race has false discovery parity, it implies that all three races have the same False Discovery Error Rate.

#### When does it matter?

If your desired outcome is to make false positive errors equally on people from all races, then you care about this criteria. This is important in cases where your intervention is punitive and can hurt individuals and where you are selecting a very small group for interventions.

### Which groups failed the audit:

**For Sex** (with reference group as **Male**)

Female with 0.76X Disparity

**For Race** (with reference group as **White**)

Black with 0.79X Disparity

Go to Top

## False Negative Rate Parity: Failed

What is it?

When does it matter?

Which groups failed the audit:

#### What is it?

This criteria considers an attribute to have False Negative parity if every group has the same False Negative Error Rate. For example, if race has false negative parity, it implies that all three races have the same False Negative Error Rate.

#### When does it matter?

If your desired outcome is to make false negative errors equally on people from all races, then you care about this criteria. This is important in cases where your intervention is assistive (providing helpful social services for example) and missing an individual could lead to adverse outcomes for them. Using this criteria allows you to make sure that you're not missing people from certain groups disproportionately.

#### Which groups failed the audit:

**For Sex** (with reference group as **Male**)

Female with **0.70X** Disparity

**For Race** (with reference group as **White**)

Black with 1.26X Disparity

Go to Top

## False Omission Rate Parity: Failed

#### What is it?

This criteria considers an attribute to have False Omission Rate parity if every group has the same False Omission Error Rate. For example, if race has false omission parity, it implies that all three races have the same False Omission Error Rate.

#### When does it matter?

If your desired outcome is to make false negative errors equally on people from all races, then you care about this criteria. This is important in cases where your intervention is assistive (providing help social services for example) and missing an individual could lead to adverse outcomes for them , and where you are selecting a very small group for interventions. Using this criteria allows you to make sure that you're not missing people from certain groups disproportionately.

### Which groups failed the audit:

**For Sex** (with reference group as **Male**)

Female with 1.28X Disparity

**For Race** (with reference group as **White**)

Black with 0.51X Disparity
